SAMPLE · BUSINESS BRAIN CASE STUDY · PROJECT ORCHESTRATION

One day, six projects, one person.

3 November 2026. Each row is a separate project. Solid bars are project chats working; striped bars are builds and AI website builder runs working on their own. Gaps are time away from the computer.

6	4	2.2	16	7
projects in one day	projects running at once, at the peak	projects running at once, on average	project chats	builds and AI website builder runs

How this was measured. Every bar comes from the timestamped log each project chat keeps as it works. A chat counts as working from 5 minutes before a logged change until its last change before a gap of more than 45 minutes; a longer gap counts as time away from the computer. A build or AI website builder run counts as running from the log line that hands it over to the line that reports it back. Builds whose log lines do not say both are left out. A chat running a long step without logging counts as idle, so these figures are the lowest the logs support. Measured on Vincent Scully's own businesses.
